CAUTION: This email originated from outside of the organization.

Dear Mr. Martig,

The Environmental Quality Board (EQB) has received a petition requesting that an Environmental Assessment Worksheet (EAW) be prepared for the proposed Kraewood Development, and has determined the City of Northfield is the appropriate governmental unit to decide the need for an EAW.

Attached to this email you will find the petition as submitted to the EQB ("Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development Signatures Attached_Compressed.pdf") as well as a letter ("Kraewood Development_Petition Transmittal Letter.pdf") with information on how to proceed with the petition according to Minnesota Rules 4410. Upon receipt, please confirm you have received both attachments.

If you have questions, please contact me at 651-757-2418.

Regards,

Katrina Hapka

RE: Petition for an Environmental Assessment Worksheet for the proposed Kraewood Development

Dear Mr. Martig,

The Environmental Quality Board (EQB) received a petition on September 15, 2021 requesting that an Environmental Assessment Worksheet (EAW) be prepared for the project described in the petition, and has determined the City of Northfield is the appropriate governmental unit to decide the need for an EAW.

The requirements for environmental review, including the preparation of an EAW, can be found in Minnesota Rules, chapter [4410](#). The procedures to be followed in making the EAW decision are set forth in part [4410.1100](#). Key points in the procedures include:

1. No final governmental approvals may be given to the project named in the petition, nor may construction on the project be started until the need for an EAW has been determined. Project construction includes any activities which directly affect the environment, including preparation of land. If the decision is to prepare an EAW, final governmental approval must be withheld until either a negative declaration on the need for an Environmental Impact Statement (EIS) is issued or an EIS is determined adequate. See part [4410.3100](#), subparts 1 and 2 for the prohibitions on final governmental decisions.
2. To make the decision on the need for an EAW, compare the project to the mandatory EAW, EIS, and exemption categories listed in parts [4410.4300](#), [4410.4400](#), and [4410.4600](#), respectively. If the project should fall under any of these categories, environmental review is automatically required or prohibited. If this should be the case, proceed accordingly:
 - a. If the project meets or exceeds the thresholds of any mandatory EAW or EIS category, then environmental review is required for the project. Please see the guidance documents on the [EQB website](#) for preparing an EAW or EIS.
 - b. If the project is exempt from environmental review, please document the reason for the exemption in writing and notify both the petitioners' representative and EQB of your conclusion.
3. If preparation of an EAW is neither mandatory nor exempted, the City of Northfield has the option to prepare a discretionary EAW in accordance with part [4410.1000](#), subpart 3, item B. The standard for making the decision on the need for an EAW is provided in part [4410.1100](#),

September 17, 2021

subpart 6. When considering the evidence provided by the petitioners, proposers, or other persons, the City of Northfield must take into account the factors listed in part [4410.1700](#), subpart 7. Note that this requires that a record of decision, including specific findings of fact, be maintained.

4. You are allowed up to 30 working days (Saturdays, Sundays and holidays do not count) for your decision if it will be made by a council, board, or other body which meets only periodically, or 15 working days if the decision will be made by a single individual. If the decision will be made by an individual, the individual may request an additional 15 working days from the EQB in accordance with part [4410.1100](#), subpart 7.
5. You must provide written notification of your decision to the proposer, the petitioners' representative, and the EQB, within 5 working days as described in part [4410.1100](#), subpart 8. Please provide written notification to these parties even in cases where an EAW or EIS will be prepared according to part [4410.1000](#), subparts 2 or 3, or the project is found to be exempt from environmental review.
 - a. To notify the EQB of your decision on the need for an EAW, complete the [EQB Monitor submission form](#) found on the EQB website. The EQB requests that you upload a copy of your record of decision using the same electronic submission form, including instances where environmental review is mandatory, voluntary, or exempt.
6. If for any reason you are unable to act on the petition at this time (e.g., no application has yet been filed or the application has been withdrawn or denied), the petition will remain in effect for a period of one year, and must be acted upon prior to any final decision concerning the project identified in the petition. It is recommended that you notify in writing both the petitioners' representative and the EQB if you are unable to act on the petition at the time it is received.

Notice of the petition and its assignment to your unit of government will be published in the *EQB Monitor* on September 21st, 2021.

If you have any questions or need any assistance, please do not hesitate to contact us at env.review@state.mn.us or 651-757-2873.

Sincerely,

Katrina Hapka

**Petition for an Environmental Assessment Worksheet (EAW)
Proposed Kraewood Development, Northfield, MN**

Environmental Quality Board August 26, 2021

Petitioners' Representative: Diane Angell angell@stolaf.edu

409 Ivanhoe Ave. Northfield, MN 55057

Project Description

We submit this petition requesting an **Environmental Assessment Worksheet (EAW) for the Paulson Woods or Tree Farm Property** ("Kraewood Development") on the west side of the City of Northfield, Rice County, MN. The preliminary plat (Exhibit 1) was approved by the Planning Commission (8/19/21) and will be voted on at the Northfield City Council Meeting (9/7/21 or 9/21/21). No EAW has previously been completed and the City of Northfield has, so far, chosen not to require an EAW or any kind of Environmental Assessment for this project despite the fact that more than 600 citizens showed support for such a request in a document sent to City Staff, Planning Commission Members and City Council Members. TIF funding is being requested and will be reviewed at the Northfield Housing and Redevelopment Authority Meeting (8/31/21).

This development is a high density residential infill development taking place on 12.88 acres. Current plans include 130 total units, consisting of a 100 unit apartment building (which will be the biggest single apartment building in town), 4 row homes, 4 twin homes and 22 single family homes (Exhibit 1).

The property is situated between Greenvale Avenue on the south and Lincoln Parkway on the north. It is directly across the street from Greenvale Elementary School and the Northfield Community Education Center. The development is located in a region identified by the Minnesota Pollution Control Agency as an Environmental Justice Area due to poverty (40% of the people are 185% below poverty level). This listing is also noted in the Environmental Review Projects Interactive Map at <https://mpca.maps.arcgis.com/apps/MapSeries/index.html?appid=f5bf57c8dac24404b7f8ef1717f57d00>.

Parts of the upland grassy section of the property were used in the past as a Christmas tree farm but there is mature native forest on the property with 14 native trees species, including basswood, oak and sugar maple and substantial populations of spring ephemerals, including trout lilies, bluebells and snow trillium. The development as currently planned will remove over 75% of the mature trees on the property and 90% of the 12.88 acres will be cleared (Exhibit 1). There are two potential wetland areas, one of which has a large patch of native sedges. Greenvale Creek flows just over 250 ft from the NE corner of the property and has experienced flooding during heavy rains in the past.

The project's location in the midst of a well documented rusty patched bumble bee population along with the match of this property to the habitat needs of this Endangered Species demand a professional and transparent Environmental Assessment Worksheet be conducted during the months when this bee is active. Given that the rusty patched bumble bee may only be active above ground between about March 15 and October 15 any bumble bee surveys on the property should occur well after or before these dates. (Exhibit 2, Section 7 Guidance USFWS, p9, found at https://www.fws.gov/midwest/endangered/insects/rpbb/pdf/Section_7_Guidance_RPBB_Ver2_1_16April2019.pdf)

Environmental Effects

This development will impact the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, by eliminating habitat and by reducing the quality of that habitat. The property may also have existing wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area. Increased traffic in the area is also a concern.

I. Impacts on the Federally Endangered Rusty patched bumble bee**A. Background**

Populations of bumblebees and other pollinators have declined over the past several decades due to numerous threats, including habitat loss and degradation. The rusty patched bumble bee was listed as an Endangered species in 2017 after its population had dropped by 90% and has been designated Minnesota's State Bee.

Section 7 Guidance states that to increase the likelihood that the Rusty patched bumble bee avoids extinction, it will be necessary to do the following:

- 1. Prevent further declines by protecting remaining populations and the habitat needed to support them (this is paramount);*
 - 2. Increase the number of healthy populations and ensure they are distributed across an array of environmental gradients;*
 - 3. Improve its abundance across the range of ecological settings with which it was associated historically; and,*
 - 4. Restore multiple, healthy populations to preserve adaptive capacity.*
- (Exhibit 2, Section 7 Guidance, p3)

In addition, the United States Fish and Wildlife Service has identified Northfield as an important area for Rusty Patched conservation:

- 1. The abundance and density of recent observations in Northfield means our city is currently highlighted by the **USFWS as a High Potential Zone** (where presence should be presumed for ESA section 7 purposes) 2/10/2020 (Exhibit 3 USFWS RPBB Map found at <https://www.fws.gov/midwest/endangered/insects/rpbb/rpbbmap.html>).*

2. Northfield is also in the **USFWS Tier One Priority Region** for rusty patched habitat assessments, habitat improvement and surveys (Exhibit 4 USFWS Priorities Map found at <https://www.fws.gov/midwest/endangered/insects/rpbb/PrioritiesMap.html>)

B. Evidence of rusty patched bumble bees on properties surrounding planned development.

The Paulson Woods Property is adjacent to a number of verified recent sightings of the Federally Endangered rusty patched bumble bee uploaded on the citizen science website, Bumble Bee Watch (Exhibit 5, Bumble Bee Watch Map, also accessible at <https://www.bumblebeewatch.org/>). Since the property is private, no surveys have been completed on the property itself.

- Rusty patched bumble bees have been observed in each of the last 4 years in diverse locations around the property including 2 queens. Observations on bumble bee watch are a small sample of all the rusty patched bumble bees observed near this property.
- In the last 45 days, 7 rusty patched bees have been identified from 6 different streets in the area. These include, two rusty patched confirmed foraging 150 ft from the property (Ivanhoe Ave.), two confirmed foraging 350 ft from the property (Oxford St.), two confirmed foraging 500 ft from the property (Orchard St.), one confirmed foraging 500 ft (Manitou St.) and two confirmed foraging 600 ft from the property (Linden St.) and one confirmed foraging 600 ft from the property on (Highland Ave).
- Last summer (2020), many other individuals were observed around the property, including a worker that was foraging within 50 ft of the property line and a queen foraging within 500 ft of the property line (Exhibit 6). Other individuals have been confirmed from 2018 and 2019.
- The density of sightings in this part of town is unusual. Rusty patched bumble bees are almost entirely absent from other parts of our City, despite regular searching. There has been only 1 other confirmed observation in an area beyond this part of town and 1 observation whose location is still pending.
- These bumble bees are rare even outside of town. In 2019 several thousand bees were identified in almost 200 hours of bumble bee surveying in and around Northfield. Out of almost 1,000 bumble bees identified on St. Olaf's Natural Lands in 2019 (approximately a mile west of the Paulson Woods Property), 3 individuals were identified as rusty patched. Out of almost 1,000 bumble bees identified on Carleton's prairie, no rusty patched were observed. During equally large surveys from 3 other large remnant prairies within 10 miles of Northfield (DNR and Prairie Bank Properties) NO rusty patched bees were observed (data available and shared upon request).

C. Potential Rusty Patched Bumble Bee Habitat on the Property

Section 7 Guidance published by the USFWS suggests that the Paulson Property likely includes **key habitat features that are necessary for several parts of the life cycle** of the rusty patched

bumble bee (Exhibit 2, Section 7 Guidance, Table 1). Rusty patched bumble bees need habitat that provides nectar and pollen from flowers, nesting sites during the summer period of colony growth and overwintering sites for queens. Section 7 Guidance highlights that bumble bee species typically forage within a few hundred meters of their nest, so observations of workers and queens on either side of the property makes it likely that these bees are using the property itself (Exhibit 2, Section 7 Guidance p. 9). Since the development is occurring on private property the property itself has not been surveyed. However recent tree inventory (Exhibit 7, Tree Inventory from Rebound Associates) and diverse photos from previous years and from part of the property accessible from a sidewalk, illustrate the size and maturity of trees and the diverse spring ephemerals located on the property (Exhibit 8). While rusty patched bumble bees are using the floral resources available in neighboring properties, these areas are not likely to serve the nesting needs and especially the overwintering needs of the rusty patched bumble bee.

Section 7 Guidance highlights the importance of Woodland Spring Ephemerals as important habitat for emerging rusty patched queens in the spring (Exhibit 2, p 8). Sections of the existing woodland on the property are high quality with large populations of native spring ephemerals. These ephemeral species include trout lilies, native woodland sedges, wild ginger and bluebells, bloodroot, false rue anemone, woodland phlox and buttercups (Exhibit 8).

Recent research particularly highlights the critical role of spring ephemerals to rusty patched bumble bees (Exhibit 9, Mola et al. Research Paper 2021). This research has documented a decline in abundance of bumblebee forage plants in forest understories, which their analysis suggests provide the primary nectar and pollen sources for foundress queens in spring, a critical life stage in bumblebee demography. They highlight their findings are important for bumble bee conservation and conclude that the continued loss of early season floral resources may add additional stress to critical life stages of bumble bees and limit restoration efforts if not explicitly considered in pollinator conservation. These spring ephemerals do not exist in the neighborhood gardens around the property.

Section 7 Guidance also highlights upland grasslands and shrublands as important nesting sites for rusty patched bumble bees, indicating they may also forage as far as 30 meters into the edges of forest and woodland during the summer (Exhibit 2, p 9). The maintenance of parts of the property as grassland with small Christmas trees matches this habitat need.

Section 7 Guidance also suggests that the species winters exclusively in upland forest and woodland (Exhibit 2, p 9). Upland patches of mature forest are highlighted in the tree inventory (Exhibit 7). The Paulson Woods Property is clearly designated in Northfield's Comprehensive Plan as "Woodland and Forest" (Exhibit 10 Chapter 5 Environmental Resources, Map 5.2). It is also identified as a "Forest" in the Northfield Natural Resources Inventory (Exhibit 11, Map, p22), as "Upland Deciduous Forest" (Exhibit 11, Map Fig. 5 p23) and as having "Medium" Wildlife Habitat Value (Exhibit 11, Map Fig. 6 p51).

The tree inventory (Exhibit 7) of the property noted 14 different native species of trees including basswood, hackberry, cherry, Kentucky coffee tree, poplar, oaks, sugar maples, ash, native elms, honeylocust, willow, box elder. This same inventory counted 1,189 trees over 6

inches in diameter (smaller trees were not counted). 874 trees or 75% will be removed for this development due to its high building density and the large parking areas required for the apartment building. Almost a third of the trees that are currently slated for removal are over 12 inches in diameter. We estimate 90% of the site will be cleared of vegetation (Exhibit 1 Preliminary Plat).

The total amount of above ground carbon stored on site in trees above 6" dbh is 830,701.7 pounds, or about 415 tons. The total amount of carbon stored by the trees proposed for removal is 535,861.6 pounds, or 268 tons. The project will remove 64.5% of the carbon stored by trees on the site. These calculations are based on species specific values and equations published in *Forest Science* by Jenkins et al in 2003 (calculations available upon request).

D. Rusty Patched Bumble Bee Impacts

This development has the potential to directly reduce the rusty patched bumble bee population by killing or harming individuals during the development process. Forest clearing and vehicles necessary during the building process may kill individuals, affect bee movement, negatively affect vegetation that bees rely on for floral resources (nectar and pollen) and compact soil where queens are overwintering or summer colonies are located.

The clearing of approximately 90% of the 12.88 acres will eliminate the upland forest overwintering sites preferred by rusty patched queens, and eliminate the early spring nutrition those queens rely on in the form of early flowering spring ephemerals. Clearing will also eliminate the potential grassland habitat that may be used as locations for colony establishment over the summer and for summer and fall pollen and nectar collection.

Areas not entirely cleared may also experience loss of cover and other disturbances that impact rusty patched bumble bees by reducing the quality of that remaining habitat.

2. Potential Wetlands on the Property and Concerns Regarding Stormwater Runoff

The Paulson Property has two areas that may qualify as wetlands, one at the northeast corner and another in the south east section of the property. The wet area in the northeast section includes a patch of native sedges (Exhibit 8 Property photos). In addition, much of the runoff from the property flows into Greenvale Creek which is 250 ft from the NE corner of the property and regularly experiences flooding. One intersection to the NW has been completely submerged in a past flooding event (Lincoln Pkwy and Cannon Valley Pkwy) and another to the NE has almost been submerged (Lincoln Pkwy and Linden St.).

The currently proposed Preliminary Plat highlights that the proportion of impervious surface will increase dramatically, from its current level of just over 1.2% to almost 46.8%. Buildings will cover 22% of the property and pavement 24.7%. Given an estimated 90% of the site will be cleared of vegetation, the water holding capacity of the site will be dramatically reduced (Exhibit 1 Preliminary Plat).

- Northfield's **Comprehensive Plan** highlights that there are **hydric soils** on the Paulson Woods Property. **A professional wetland delineator** should survey the property (Exhibit 12 Comprehensive Plan, Chapter 5, Map 5.1 available at <https://www.ci.northfield.mn.us/286/Comprehensive-Plan>).
- Northfield's **Surface Water Management Plan** also highlights that parts of this property have soils **classified as "C," indicating "slow infiltration rates ranging from .05-.15 inches per hour when thoroughly wetted."** (Exhibit 13 Northfield Surface Water Management Plan, Fig III-11, p30 available at <https://www.ci.northfield.mn.us/DocumentCenter/View/613/Northfield-Comprehensive-Surface-Water-Mgmt-Plan-091007?bidId>)

Wetland and Runoff Impacts

The increase in impervious surface and the clearing of the majority of the property will directly eliminate wetlands, dramatically reduce the ability of the property to hold, filter and recharge groundwater in the area, increase runoff and worsen flooding events along Lincoln Pkwy and in the yards of neighboring properties. With increases in severe rain events in the future, we expect flooding to become more common in this area, especially with the increase in impervious surface and the extent of clearing taking place as part of this development. Runoff, the sediment and the soil saturation that follows impacts the quality of the area for nesting rusty patched queens.

3. Increased Traffic

Lincoln Pkwy is a heavily used street designated as a minor arterial and the addition of this large 130 Unit development will add to traffic on that road and along Greenvale Ave. to the south (Exhibit 14 Northfield Public Works Slides). This traffic is also a safety concern for children given that Greenvale Elementary School and the Northfield Community Education Center are located directly across Lincoln Parkway opposite the development. The development is also located in a region identified by the Minnesota Pollution Control Agency as an Environmental Justice Area due to poverty (40% of the people are 185% below poverty level). This listing is also noted in the Environmental Review Projects Interactive Map at

<https://mpca.maps.arcgis.com/apps/MapSeries/index.html?appid=f5bf57c8dac24404b7f8ef1717f57d00>.

While traffic will increase throughout the area due to the development, Bolton and Menk highlight that Greenvale Ave. heading west from the development will experience a 14.7% increase in traffic (Exhibit 15 Traffic Review).

Increased Traffic Impacts

Several rusty patched observations have occurred along the section of roadway that will experience the greatest increase in traffic. Additional traffic in that particular area will impact the ability of worker bumble bees to access floral resources and impact the ability of queens to move between overwintering forest sites and potential summer nesting and foraging areas in neighborhoods to the south where the frequency of sightings is high during the summer. Increased traffic in the area overall also reduces the quality of habitat due to the added vehicle emissions.

4. Significant Environmental Effects

“Kraewood Development” poses significant environmental effects. Development has the potential to affect the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by reducing their population directly (harming individuals) during the construction process, increased traffic, compaction of soils where bees are nesting. Clearing 90% of the property will eliminate potential habitat on the property and a diversity of activities will reduce the quality of any remaining habitat. Development risks eliminating potential wetlands on the property and clearing of the property of its grasslands and forests will increase runoff and worsen flooding in the area.

RESEARCH ARTICLE

Long-term surveys support declines in early season forest plants used by bumblebees

John M. Mola , Leif L. Richardson, Greg Spyreas, David N. Zaya, Ian S. Pearse

First published: 18 April 2021 | <https://doi.org/10.1111/1365-2664.13886>

Handling Editor: Ainhua Magrach

Abstract

1. Populations of bumblebees and other pollinators have declined over the past several decades due to numerous threats, including habitat loss and degradation. However, we can rarely investigate the role of resource loss due to a lack of detailed long-term records of forage plants and habitats.
2. We used 22-year repeated surveys of more than 262 sites located in grassland, forest, and wetland habitats across Illinois, USA to explore how the abundance and richness of bumblebee food plants have changed over the period of decline of the endangered rusty patched bumblebee *Bombus affinis*.
3. We documented a decline in abundance of bumblebee forage plants in forest understories, which our phenology analysis suggests provide the primary nectar and pollen sources for foundress queens in spring, a critical life stage in bumblebee demography. By contrast, the per-unit area abundance of food plants in primarily midsummer-flowering grassland and wetland habitats had not declined. However, the total area of grasslands had declined across the region resulting in a net loss of grassland resources.
4. *Synthesis and applications.* Our results suggest a decline in spring-flowering forest understorey plants is a previously unappreciated bumblebee stressor, compounding factors like agricultural intensification, novel pathogen exposure and grassland habitat loss. These findings emphasize the need for greater consideration of habitat complementarity in bumblebee conservation. We conclude that the continued loss of early season floral resources may add additional stress to critical life stages of bumblebees and limit restoration efforts if not explicitly considered in pollinator conservation.

Exhibit 10. Paulson Woods is highlighted in Northfield’s Comprehensive Plan as “Woodland and Forest” (Chapter 5 Environmental Resources, Natural Community Quality and Semi-Natural Areas Map 5.2). <https://www.ci.northfield.mn.us/286/Comprehensive-Plan>

Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development

We, the undersigned, live in and/or own property in the state of Minnesota and request the preparation of an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development, located in the City of Northfield, Rice County. By signing below, I support the material evidence submitted in the attached petition and believe that, because of the **nature or location of the proposed project there may be potential for significant environmental effects** including, but not limited to:

- Impacts on the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, eliminating habitat and reducing habitat quality.
- Elimination of potential wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area.
- Increased traffic will reduce the quality of the habitat for the rusty patched bumble bee.

Minnesota's Environmental Review Program rules require that a citizen petition contain the [legible] signatures and mailing addresses of at least 100 individuals who reside or own property in the state. The EQB has the responsibility to monitor the effectiveness of Minnesota's Environmental Review Program and to make improvements to the process when needed (MR 4410.0400). Please include your phone number if you are willing to have EQB staff contact you to talk about your experience with the petition process.

Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development

I, the undersigned, live in and/or own property in the state of Minnesota and request the preparation of an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development, located in the City of Northfield, Rice County. By signing below, I support the material evidence submitted in the attached petition and believe that, because of the nature or location of the proposed project there may be potential for significant environmental effects including, but not limited to:

- Impacts on the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, eliminating habitat and reducing habitat quality.
- Elimination of potential wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area.
- Increased traffic will reduce the quality of the habitat for the rusty patched bumble bee.

The Minnesota Environmental Review Program rules require that a citizen petition contain the [legible] signatures and mailing addresses of at least 100 individuals who reside or own property in the state. The EQB has the responsibility to monitor the effectiveness of Minnesota's Environmental Review Program and to make improvements to the process (MR 4410.0400). Please include your phone number if you are willing to have EQB staff contact you to talk about your experience with the petition process.

Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development

We, the undersigned, live in and/or own property in the state of Minnesota and request the preparation of an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development, located in the City of Northfield, Rice County. By signing below, I support the material evidence submitted in the attached petition and believe that, because of the **nature or location of the proposed project there may be potential for significant environmental effects** including, but not limited to:

- Impacts on the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, eliminating habitat and reducing habitat quality.
- Elimination of potential wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area.
- Increased traffic will reduce the quality of the habitat for the rusty patched bumble bee.

Northfield

Minnesota's Environmental Review Program rules require that a citizen petition contain the [legible] signatures and mailing addresses of at least 100 individuals who reside or own property in the state. The EQB has the responsibility to monitor the effectiveness of Minnesota's Environmental Review Program and to make improvements to the process when needed (MR 4410.0400). Please include your phone number if you are willing to have EQB staff contact you to talk about your experience with the petition process.

Northfield Resident

Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development

Northfield

We, the undersigned, live in and/or own property in the state of Minnesota and request the preparation of an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development, located in the City of Northfield, Rice County. By signing below, I support the material evidence submitted in the attached petition and believe that, because of the **nature or location of the proposed project there may be potential for significant environmental effects** including, but not limited to:

- o Impacts on the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, eliminating habitat and reducing habitat quality.
- o Elimination of potential wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area.
- o Increased traffic will reduce the quality of the habitat for the rusty patched bumble bee.

Minnesota's Environmental Review Program rules require that a citizen petition contain the [legible] signatures and mailing addresses of at least 100 individuals who reside or own property in the state. The EQB has the responsibility to monitor the effectiveness of Minnesota's Environmental Review Program and to make improvements to the process when needed (MR 4410.0400). Please include your phone number if you are willing to have EQB staff contact you to talk about your experience with the petition process.

Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development

We, the undersigned, live in and/or own property in the state of Minnesota and request the preparation of an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development, located in the City of Northfield, Rice County. By signing below, I support the material evidence submitted in the attached petition and believe that, because of the nature or location of the proposed project there may be potential for significant environmental effects including, but not limited to:

- Impacts on the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, eliminating habitat and reducing habitat quality.
- Elimination of potential wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area.
- Increased traffic will reduce the quality of the habitat for the rusty patched bumble bee.

Northfield

Minnesota's Environmental Review Program rules require that a citizen petition contain the [legible] signatures and mailing addresses of at least 100 individuals who reside or own property in the state. The EQB has the responsibility to monitor the effectiveness of Minnesota's Environmental Review Program and to make improvements to the process when needed (MR 4410.0400). Please include your phone number if you are willing to have EQB staff contact you to talk about your experience with the petition process.

Petition for an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development

We, the undersigned, live in and/or own property in the state of Minnesota and request the preparation of an Environmental Assessment Worksheet for the Kraewood (Paulson Tree Farm) Development, located in the City of Northfield, Rice County. By signing below, I support the material evidence submitted in the attached petition and believe that, because of the nature or location of the proposed project there may be potential for significant environmental effects including, but not limited to:

- Impacts on the Federally Endangered rusty patched bumble bee (*Bombus affinis*) by directly reducing its population, eliminating habitat and reducing habitat quality,
- Elimination of potential wetlands and disturbance of existing grasslands and forests will increase runoff and worsen flooding in the area.
- Increased traffic will reduce the quality of the habitat for the rusty patched bumble bee.

Minnesota's Environmental Review Program rules require that a citizen petition contain the [legible] signatures and mailing addresses of at least 100 individuals who reside or own property in the state. The EQB has the responsibility to monitor the effectiveness of Minnesota's Environmental Review Program and to make improvements to the process when needed (MR 4410.0400). Please include your phone number if you are willing to have EQB staff contact you to talk about your experience with the petition process.
